

What You Can Control

You're hearing it constantly: AI is taking jobs. That headline used to be a prediction. Now it's news.

And jobs are just the loudest headline. AI is also reshaping who holds power, what it costs the planet, and what you can trust online. Which way it all goes, nobody knows yet, including the people making the predictions. And almost none of it is in your hands.

So here's the question worth asking: what's in your hands, and what isn't?

Most of the noise around AI is the left column. Most of the leverage in your life is the right column.

SO WHAT DO YOU DO?

That right column isn't a feeling, it's a to-do list. Three moves worth your energy:

- 1 Get genuinely good with AI, not just familiar.**
Pick one tool and go deep: what it's great at, where it gets things wrong, how to push it. Depth beats dabbling.
- 2 Do the thinking first, then bring AI in.**
Form your own take before you ask, then use AI to sharpen it instead of skipping it. That's the line between getting smarter and just getting answers.
- 3 Don't get caught up in the hype. Close the tab and go learn.**
You can't control the headlines. You can control whether you doomscroll them or spend that hour getting better at something real.

Controlling your skill and judgment isn't a consolation prize for the stuff you can't change. It's the one lever that actually tilts your odds, even when the big forces aren't yours.

The volume is loud. The dial is yours.

Skill and judgment tilt your odds.
